HIA-C gene, DNA probe and transformant cells - for immunisation of animals and monoclonal antibody development.

Claim 2; Page 1; 13pp; Japanese.

Probes comprising part of the sequence can be used to identify class I genes. The DNA can be expressed for immunisation of animals and produ. of monoclonal antibodies specific for the HIA-C antimals and produ. of sequence and 101112486 and J03112487.

Sequence 1101 BP; 215 A; 335 C; 379 G; 172 T;
                                                                                                                                                                                                      HIA-C gene, DNA probe and transformant cells - for immunisation of animals and monoclonal antibody development.

Claim 1; Page 1; 13pp; Japanese.

Probes comprising part of the sequence can be used to identify class I genes. The DNA can be expressed for immunisation of animals and prodn. of monoclonal antibodies specific for the HIA-C animals and prodn. of monoclonal antibodies specific for the HIA-C sequence 1101 BP; 211 A; 337 C; 377 G; 176 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human leukocyte antigen; probe; major histocompatibility complex; MHC; class I; ss.

The present sequence represents a Amycolatopsis mediterranei rifamycin and rifamycin analogues

CIAIM 4; Page 53-102; 205pp; English.

CIAIM 5 And Fragment Comprises a DNA region involved directly or indirectly or modifying genes (luster, and functional or indirectly or modifying genes involved in ansamycin or indirectly or modifying genes involved in ansamycin or indirectly or completely deleted. The ONA fragment can be used for assembling a library of polyketide or synthesis gene cluster has been partly or completely deleted. The DNA fragment can be used for assembling a library of polyketides.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       E E E E
                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (V52134 to V52524) recorded on it, or a representative fragment or a sequence at least 958 identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 to 391. The nucleotide sequences depicted in SEQ ID NO: 1 to 391 (V52134 to V52524) are genomic fragments from Streptococcus pneumoniae. The present invention also describes an isolated nucleic acid molecule encoding a homologue of any of the fragments of the Spneumoniae genome (SEQ ID NO:1 to 391) where the nucleic acid molecule is produced
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                by a process comprising: (a) screening a genomic DNA library using as a probe a target sequence defined by any of the sequences in SEQ ID NO:1 to 31, identifying members of the library which contain sequences that hybridise to the target sequence and isolating the nucleic acid molecules from the members: or (b) isolating mRNA, DNA or CDNA produced from an organism, amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification primers derived from the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            fragment of the S. pneumoniang genome to prime the amplification and isolating the amplified sequences. The computer readable medium can be used in a computer-based system for identifying fragments of the S. pneumoniae genome of commercial importance, or expression modulating fragments of the S. pneumoniae genome. Products from the present invention can be used in diagnosis kits and assays, and pharmaceutical sequence 11770 BP; 3673 A; 1919 C; 2574 G; 3603 T;

The present invention describes a computer readable medium which has
The present invention describes a computer readable medium which has
The present invention describes a computer readable medium which has
The nucleotide sequences SEQ ID No.: 1 to 391 (752134 to V52524) recorded
The nucleotide sequences are general to sequence depicted in SEQ ID No.:
To 391 (V52134 to V52524) are genomic fragments from Streptococcus
The present invention also describes an isolated nucleic acid
molecule encoding a homologue of any of the fragments of the S. pneumoniae
The present invention also describes an isolated nucleic acid
molecule encoding a homologue of any of the fragments of the S. pneumoniae
The present invention also describes an isolated nucleic acid
molecule encoding a homologue of any of the sequences in SEQ ID No::
That hybridise to the target sequence and isolating the nucleic acid
molecules from the members; or (b) isolating mRNA, DNA or CDNA produced
from an organism, amplifying nucleic acid molecules whose nucleotide
Sequence is homologous to amplification primer the amplification and
isolating the amplified sequences. The computer readable medium can be
used in a computer-based system for identifying fragments of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               5. pneumoniae genome of commercial importance, or expression modulating fragments of the S. pneumoniae genome. Products from the present invention can be used in diagnosis kits and assays, and pharmaceutical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Computer readable medium with recorded Streptococcus pneumoniae polynucleotide sequences - useful in diagnostic kits and assays, and pharmaceutical compositions and vaccines for Streptococcus
                                                                                                                                                                                                                                                                                                                                                                                     Streptococcus pneumoniae genome fragment SEQ ID NO:134.

                                                                                                                                                                                                                                                                                                                                                                                                                           Protecting plants against pathogens with genetically transformed biological control agant - which expresses all polypeptide(s) biological control agant - which expresses all polypeptide(s) and pyrolnitrin biosynthetic pathway as 1 biological control agant - which expresses all polypeptide(s) and pyrolnitrin biosynthetic pathway as 16; Column 104-128; 88pp; English.

This genomic DNA sequence encodes the Soraphen gene cluster. This sequence encodes two open reading frames (ORF's), the positions of which are not given in the specification. ORF's, the positions of which size and encodes 5 biosynthetic modules homologous to the erythromycin genes of Saccharopolyspora erythraea. Each module contrains character of CKR) and an acyl carrier protein (ACP domain. ORF2 is immediately adjacent to ORF1 and is thought to contain 3 modules. Soraphen is a type I polyketide synthase (PKS), which has antiblotic activity. Transgenic plants containing such antipathogenic genes like those actack by phytopathogens. Shoraphen cluster should have enhanced resistance to attack by phytopathogens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence contains a cluster of genes that encode polyketide synthases (PKSs) that are involved in the synthasis of soraphens in sorangham cellulosum. The proteins encoded by the present sequence are Sorangium cellulosum. The proteins encoded by the present sequence are Soran, Sorah, SorB and SorM. SorA and SorB contain biosynthetic modules which contain a beta-ketoacylsynthase, an acyltransferase, a ketoreductase and an acyl carrier protein domain, as well as beta-ketone processing domains. S. cellulosum soraphens are useful as a cytostatic and antimicrobial agent active against phytopathogenic fungi. Soraphen-producing transgenic plants or biological control agents can also be produced, which may reduce crop losses and nutritional deprivation for local populations in many parts of the world sequence 49377 BP; 19522 C; 14477 G; 8131 T;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated swine hepatitis E virus - used to develop products for the diagnosis, prevention and treatment of hepatitis E virus infection in mammals, particularly humans Example 1; Fig 6A-C; 70pp; English.

This invention describes a swine hepatitis E virus (HEV) and its natural mutants which are capable of cross-reacting with antibodies reactive with a human HEV strain or natural mutants. The HEV and the proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Swine HEV ORF 1 DNA.

The fight of the first than the first firs
can be used in vaccines for immunising against HEV infection. The swine HEV can be used in humans to prevent possible infection by human HEV. The swine HEV can also be used as a therapeutic treatment for infection by other strains of HEV. The swine HEV can also be used for the production of antibodies which can be used in therapy, detection and diagnosis. The products can also be used for determining the susceptibility of cells or organs to infection with swine HEV. The swine HEV is particularly useful for the development of agents for the prevention, treatment and detection of human HEV because it is not a human virus and thus can be handled both experimentally and clinically without fear of severe infection and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       11-JUN-1999 (first entry)

Talministry Tage 22-24; 36pp; English.

The antigenic polypeptide encoded by this sequence, its fragments and variants can be used in a vaccine to protect against infection by a cestode parasite, particularly in ruminants. The nucleic acids (See also T17934) can be used to produce recombinant viral vaccines. The DNA (preferably this DNA sequence) can also be labelled and used as a probe to identify nucleic acids encoding a protective antigen of an Echinococcus or Taeniid parasite other than Taenia ovis. New protective antigen from Taenia ovis - and related DNA vectors, transformed cells and antibodies, useful in vaccines, also for detecting homologous genes and proteins Disclosure; page 22-23; 37pp; English.

A T. ovis oncosphere lambda gill cDNA library was screened with rabbit antibodies raised against a 16 kDa protective antigen of T. ovis. The insert from a selected clone was subcloned into vector pGEX-2T and expressed as a glutathione-S-transferase fusion protein in Escherichia coli JMIOI. The DNA and predicted amino acid sequences of the T. ovis portion of the fusion protein were
                                                                                                                                                                                                                                  determined.

AI102538 648 bp mRNA EST 08-JAN-1999
EST211827 Normalized rat embryo, Bento Soares Rattus sp. cDNA clone
REMBO96 3' end, mRNA sequence.
                                                                                                                                    /note="Organ: brain; Vector: pBluescript SK- (Stratagene); Site_1: ECORI; Site_2: KhOI; Double-stranded cDNA was prepared from human astrocytoma using primer 5.-GAGNGAGAGAGAGAGAACTRGTCGAGT(AB)-3. An ECORI adaptor was used on the 5' end of the cDNA as follows: 5.-AATTCGGCAGGAG." The library was size-selected and went through one round of amplification. Average insert size is 1.7 kb, with a range from 0.4-12 kb. Tumor dentification by consensus pathology. This library was University).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Rattus sp.

LOCUS AA313054
DEFINITION EST183851 Pancreas tumor, subtracted (abundant clones) Homo saplens
CDNA 5' end similar to similar to major histocompatibility complex,
class 1, A3101, mRNA sequence.
ACCESSION AA313054
VERSION AA313054.1 GI:1965382
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Initial assessment of human gene diversity and expression patterns based upon 83 million nucleotides of cDNA sequence Nature 377 (6547 Suppl), 3-174 (1995)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Email: arkerlar@tigr.org

SHIRAYAMA M., KAWAKAMI K., MATSUI Y., TANAKA K., TOH-E A.;
SHIRAYAMA a multicopy suppressor of mutants hyperactivated in the RAS-
CAMP pathway, encodes a novel HSP70 protein of Saccharomyces
Haemonchus contortus.

**NOTE: This is a 'working draft' sequence. It currently consists of 93 contigs. The true order of the pieces

**is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence

** as soon as if is available and the accession number will

** be preserved.

Submitted (0.3-Angu-1999) Production Sequencing Facility, DOB Joint Genome Institute.

LEST (bases 1 to 211769) Broduction Sequencing Facility, DOB Joint Genome Institute, 2800 Mitchell Drive, Walnut Creek, CA 94598, USA ON Oct 31, 1999 this Sequence version replaced gi:5686476.

* NOTE: This is a "working draft, Sequence. It currently tonsists of 60 contigs. The true order of the pieces is not known and their order in this Sequence record is arbitrary. Gaps between the contigs are represented as truns of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Direct Submission

Submitted (30-OTT-1999) Sanger Centre, Hinxton, Cambridgeshire, CB10 1SA, UK. Email enquiries: humquery@sanger.ac.uk CDne requests: clonerequest@sanger.ac.uk

On Oct 29, 1999 this sequence version replaced g1:6058975.

During sequence assembly data is compared from overlapping clones. Where differences are found these are annotated as variations together with a note of the overlapping clone name. Note that the variation annotation may not be found in the sequence submission corresponding to the overlapping clone, as we submit sequences with only a small overlap as described above.

The following abbreviations are used to associate primary accession numbers given in the feature table with their source databases:

Ems., EMBL: Sw:, SWISSEROT: Tr:, TREMBL: Wp:, WORNPEP: Information on the WORNPEP database can be found at http://www.sanger.ac.uk/Projects/C_elegans/wormpep IMPORTANT: This sequence is not the entire insert of clone 1106NLB. It may be shorter because we only sequence overlapping sections once, or the contrary and overlapping between neighbouring
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The true left end of clone 906P16 is at 142237 in this sequence. The true right end of clone d31193N1 is at 79367 in this sequence. This sequence has been finished according to sequence map criteria as follows. An attempt is made to resolve all sequencing problems, such as compressions and repeats, but not necessarily within known annotated human repeat sequence elements (e.g. Alu). Where the sequence is amoltguous, there is an annotation using the 'unsure'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Mammalla;

* NOTE: This is a 'working draft' sequence. It currently

* consists of 42 contigs. The true order of the pieces

* is not known and their order in this sequence record is

* arbitrary. Gaps between the contigs are represented as

* runs of N, but the exact sizes of the gaps are unknown.

* This record will be updated with the finished sequence

* as soon as it is available and the accession number will

* be preserved.
           2 g
This sequence was generated from part of bacterial clone contigs of human chromosome 20, constructed by the Sanger Centre Chromosome 20 Mapping Group. Further information can be found at http://www.sanger.ac.uk/HGDP/Chr20 1106N18 is from the library RPCI-5 constructed at the Roswell Park Cancer Institute by the group of Pieter de Jong. For further details see http://bacpc.med.buffalo.edu/ VECTOR: pCYPAC2.
